

Spremanje virtualnih poslužitelja

Nakon što ste [pokrenuli virtualni poslužitelj](#) i instalirali vaše aplikacije, možete spremiti taj poslužitelj kao novu sliku ili snapshot. Spremljeni virtualni poslužitelj možete ponovno pokrenuti te na taj način klonirati početni.

Spremanje Snapshota virtualnog poslužitelja

Za spremanje nije potrebno ugasiti virtualni poslužitelj već je dovoljno odabrati **Create Snapshot** za odgovarajući poslužitelj.

Filter

Launch Instance

Delete Instances

More Actions

Status	Availability Zone	Task	Power State	Age	Actions
Active	nova	None	Running	2 weeks, 3 days	Create Snapshot
Active	nova	None	Running	1 month	Create Snapshot
Active	nova	None	Running	1 month, 2 weeks	Create Snapshot

Za [pokretanje novog poslužitelja](#) odaberite **Source** → **Select Boot Source: Snapshot** i odaberite vaš Snapshot.

Spremanje slike virtualnog poslužitelja

Za spremanje slike, virtualni poslužitelje mora biti pokrenuti s diskovnim prostorom (opcijom da ne izbriše disk nakon brisanja poslužitelja). U ovom slučaju virtualni poslužitelj se mora izbrisati da se Volume otkači od poslužitelja.

Važno

Spremljena slika virtualnog poslužitelja može se pokrenuti s istim ili većim diskovnim prostorom ali ne i manjim.

Upravljačka ploča - Horizon (GUI)

Postupak spremanja slike:

Provjerite postoji li disk spojen na vaš poslužitelj s opcijom **Bootable**. **Volumes→Volumes**

Disk Format

QCOW2 - QEMU Emulator

☐ Force

Description:

Upload the volume to the Image Service as an image. This is equivalent to the `cinder upload-to-image` command.

Choose "Disk Format" for the image. The volume images are created with the QEMU disk image utility.

When the volume status is "in-use", you can use "Force" to upload the volume to an image.

Cancel

Upload

Izбришите meta podatak "signature_verified" : **Compute->Images->Update Metadata.**

Uklonite "signature_verified" klikom na oznaku "-" i spremite.

Vaša slika je spremljena, za **pokretanje** novog poslužitelja odaberite novu sliku.

Nakon toga možete izbrisati disk: **Volumes->Volumes->Delete Volumes**

Openstack Client (CLI)

Sve to možete napraviti i preko Openstack klienta preko komandne linije.

Postavite Openstack client

Pokrenite novi virtualni poslužitelj s opcijom "--boot-from-volume", ime poslužitelja u primjeru je "centos-newImage", 15 je veličina diska u GB.

```
openstack server create --image centos-7 --flavor m1.small --key-name mykey --network cro-ngi-private --boot-from-volume 15 centos-newImage
```

Izlistajte i kopirajte ID diska virtualnog poslužitelja (potrebno za korak 6 - IDVolume)

```
openstack volume list
```

[Prilagodite/instalirajte](#) aplikacije na vaš poslužitelj.

Izbrišite poslužitelj

```
openstack server delete centos-newImage
```

Uvezite novu sliku s diska

```
openstack image create --disk-format qcow2 --volume IDVolume newImageName
```

Izbrišite meta podatak "**signature_verified**" sa slike

```
openstack image unset --property signature_verified newImageName
```

Provjerite popis slika

```
openstack image list
```
